

This man is blind and doesn't know what public signs and messages say

This earpiece helps comfortably around his outer ear

It features a wide angle camera which can read text even if it's at an angle

The first time he feels a sign with his cane and asks his earpiece to read what it says

The earpiece tells him what the sign says so he takes his dog somewhere else.

He also has trouble at school because he can't see what the teacher writes on the white board

Now, he can tell his earpiece to read new text as it appears on the board

He asks his earpiece to read specifically the sign on the left.

The earpiece now tells him when new text appears but isn't as helpful because it quickly reads the text then is quiet while the teacher talks.

The earpiece tells the user that is the men's room so he proceeds there.

After making his way to the restrooms, he doesn't know which is which. The signs don't include Braille.

The user is very happy because he now knows what visual signs and messages are telling him.
