2 Standard 19 - Dynamic Programming: Identify Precise Subproblems

### 1 Instructions

• The solutions **should be typed**, using proper mathematical notation. We cannot accept hand-written solutions. Here's a short intro to LAT<sub>E</sub>X.

 $\mathbf{2}$ 

- You should submit your work through the **class Canvas page** only. Please submit one PDF file, compiled using this LATEX template.
- You may not need a full page for your solutions; pagebreaks are there to help Gradescope automatically find where each problem is. Even if you do not attempt every problem, please submit this document with no fewer pages than the blank template (or Gradescope has issues with it).
- You may not collaborate with other students. Copying from any source is an Honor Code violation. Furthermore, all submissions must be in your own words and reflect your understanding of the material. If there is any confusion about this policy, it is your responsibility to clarify before the due date.
- Posting to any service including, but not limited to Chegg, Discord, Reddit, StackExchange, etc., for help on an assignment is a violation of the Honor Code.

## 2 Standard 19 - Dynamic Programming: Identify Precise Subproblems

**Problem 1.** Given an undirected graph G(V, E) with positive weight  $c_e > 0$  for each edge  $e \in E$ , you are asked to find the shortest path from a source  $s \in V$  to a destination  $t \in V$ . For each node  $v \in V$ , denote by  $d_v$  the cost of shortest path from v to the destination t. Clearly identify the precise sub-problems to consider. That is, what is the recursive structure to leverage when designing a dynamic programming algorithm?

Answer.  $d_v$ , the distance from vertex v to the destination vertex t, can be evaluated by finding the minimum of the distances to t from each of v's neighbors plus the weight of the edge from v to that neighbor. In other words, for each  $w \in v$ 's neighbors,  $d_v = \min(d_w + c_{vw})$ . So the precise sub problems for  $d_v$  are all of the  $d_w$ s.
